Aaryan Jadhav

aaryanjjcs@gmail.com | linkedin.com/in/aaryanjadhavo1 | github.com/AaryanJ45
Available full-time January 2027

Education

University of Maryland, College Park Aug 2025 – Dec 2026 (Expected)
Master of Science in Applied Machine Learning *College Park, MD*

- Coursework: Machine Learning, NLP, Optimization, Probability & Statistics, Cloud Computing, Robotics

University of Maryland, College Park Aug 2022 – May 2025
Bachelor of Science in Computer Science, Minor in Data Science *College Park, MD*

Experience

Forward Deployed Engineering Intern Jun 2026 – Aug 2026
Hemut (Y Combinator X25) *Fresno, CA*

- Re-architected the backend from a monolith on a single EC2 instance into microservices on AWS ECS, routing all new deployments through a GitHub Actions CI/CD pipeline.
- Configured ECS autoscaling to absorb load spikes such as large fleet onboardings without over-provisioning.
- Built agentic workflows with Claude Code and Codex to automate ticket completion and QA, writing reusable skills and prompts that improved token efficiency and caught bugs before release.
- Worked on-site with customers in Illinois and California, turning same-day feedback into shipped product fixes.

Software Engineer Intern Jan 2026 – May 2026
Hemut (Y Combinator X25) *Remote*

- Built FastAPI services with PostgreSQL and Apache Kafka to process real-time telematics from 600+ trucks, saving 30,000+ operational hours.
- Shipped traffic- and compliance-aware ETAs, a real-time truck tracking map, and document storage for drivers, tractors and trailers on AWS S3.
- Developed the driver mobile app in React Native for iOS and Android, with in-app navigation, full platform sync and dedicated REST APIs.
- Debugged production through CloudWatch and ECS logs, shipping new task definitions and moving backend secrets into AWS Secrets Manager.

Machine Learning Researcher Aug 2024 – Aug 2025
University of Maryland *College Park, MD*

- Adapted a transformer merge–prune method (self-attention token merging and pruning), designed for 2D image tasks, to brain tumor classification on CT scan data.
- Reached 98% classification accuracy while reducing inference compute relative to the baseline model.

Projects

AgentBar | *Swift, AppKit, Python, Claude Code and Codex hooks* github.com/AaryanJ45/agent-menubar

- Open-source macOS menu bar app that monitors every running Claude Code and Codex session, showing its state, current tool and last prompt, with badges and notifications when a session finishes or needs permission.
- Push-based architecture: a hook binary writes session state on agent events and the app reacts to file-system events instead of polling, idling at about 15 MB and 0% CPU; AppleScript click-to-focus selects the session's terminal tab.

QuietNotch | *Swift, SwiftUI, AppKit, XCTest*

- Native macOS notch app that alerts when an AI coding agent finishes a prompt; watches session files with file-system and process-exit events, coalesces bursts in 100 ms windows, bounds reads, and rebaselines on wake.

AI Job Application Tracker | *Python, Claude Code skills, Gmail IMAP, openpyxl*

- Claude Code skill that parses job links into an Excel tracker (Greenhouse JSON API fallback for career sites that time out) and classifies Gmail replies to update interview, assessment and rejection status.

Skills

Languages: Python, TypeScript, JavaScript, SQL, Swift, Java, C/C++, OCaml
Backend & Cloud: FastAPI, Node.js, Django, PostgreSQL, Kafka, AWS (ECS, EC2, S3, CloudWatch, ECR, Secrets Manager), Docker, GitHub Actions
Frontend & Mobile: React, Next.js, React Native, SwiftUI, TailwindCSS
ML & AI: PyTorch, scikit-learn, Pandas, NumPy, Transformers, Claude Code, Codex, agent skills and hooks
